                                                                                                                                                                                                              by expressing inactive proteins or to supplement the patients own production of polypeptide. Additionally, [1] and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acids in samples, and therefore which patients may be in need of restorative therapy. The polypeptides encoded by [1] may be used as antigens in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         6986/c
                                                                                                                                                                  antibodies specific for polymorphic polypeptides. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used as diagnostic agents for detecting the presence of polymorphic
                                                                                                                                                                                                                                                                                                        therapy, and in vaccine production. (I) and the polypeptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of polymorphic polypeptides. For example, (I) may be used to treat disorders by rectifying mutations or deletions in a patient's genome that affect the activity of polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; single nucleotide polymorphism; SNP; genome; protein therapy; vaccine; probe; diagnostic assay; quantitation; restorative therapy; polymorphic; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel human nucleic acid sequences (I). CC The present sequence is one such nucleic acid sequence. Expression of (I) CC are implicated in tumour suppression or reversion and apoptosis and viral CC resistance. (I) are useful as probes or primers for detecting, CC identifying, measuring and/or amplifying nucleic acid sequences, as CC entisense reagents and for recombinant production of polypeptides. (I), CC polypeptides (II) encoded by (I), vector containing (I), cells containing CC these vectors and antibodies (Ab) against (II) are all useful for CC (especially neurodegeneration, such as Alzheimer's disease and CC (especially neurodegeneration). Nuch as Alzheimer's diseases (also immune CC (i) are used for studying the actiology of these diseases (also immune CC and inflammatory diseases). Note: In the present specification, SCQ ID 1 to 2280 are claimed in Claim 1, however only SEQ ID 1 to 2270 are shown or the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                          The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                    Sequence 163 BP; 35 A; 57 C; 41 G; 30 T; 0 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping; ss.

                                                                                            Sequence 2408, Application US/11096568A

Publication No. US20060048240A1

GENERAL INFORMATION:

APPLICANT: Alexandrov, Nickolai et al.

TITLE OF INVENTION: Sequence-Determined DNA Fragments and Corresponding Polypeptides

TITLE OF INVENTION: Therby

FILE REFERENCE: 2750-1592PUS2

CURRENT APPLICATION NUMBER: US/11/096,568A

CURRENT APPLICATION NUMBER: US/11/096,568A

CURRENT FILING DATE: 2005-04-01

NUMBER OF SEQ ID NOS: 34471

SEQ ID NO 2408

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               (GSC),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
```

sequenced from the S prime end. The sequence identifier uses the .e0' suffix because the library tag was at the 3 prime end and thus not identified. Samples were collected in Robert B. Shary's lab (University C.) Missouri-Columbial to construct three normalized CNNA libraries. Dark'sgrown maize seedlings with primary roos for the sequence identified. Samples were collected in Robert B. Shary's lab (University C.) Missouri-Columbial to construct three normalized CNNA libraries. Dark'sgrown maize seedlings with primary roos for the root and the root appears and root water poemical (1-1.6 MHz) very pential libraries are from the pinetro of the root apex and root a root seed for a certain this 500 vacts were constructed in the pinetro of the root apex and root a root method (2). The three normalized CNNA libraries were constructed in the lab of Hans Bohnert (1) and ed. 1997). This method worked in the segment (2). The three normalized CNNA libraries were constructed in the lab of Hans Bohnert (1) and ed. 1997). This method worked in the root pex and root a principle of the root was added to the order than the root pex and root and the root in the lab of Hans Bohnert (1) and ed. 1997). This method worked in the root pex and root primers were constructed in the lab of Hans Bohnert (1) and ed. 1997). This method worked in the root appears the root and the root and the root was added to the root was added to the state of the modified Oligo(dT) primers. The three normalized CNNA pagnets of the root was added to the standard to double-stranded CNNA and tagged by using modified Oligo(dT) primers. One of 4 sequence tags added to each sequence tags and the root and root and the root of the root was added to the stranded clonas were adapticed (1400 bp). Site of the root was added to the stranded clonas were adapticed (1400 bp) in the primary libraries before amplification the root was a root of the modified Oligo(dT) primers. The cDNA was elected to double-strandard into bearth the sequence tag and the formal root of the roo

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CF633642.1 GI:37392777
                                                                                                         1,000 roots were used for each of the low water potential libraries (zmrws05 and zmrws48) while 500 roots were combined from each of the two time points at high water potential (zmrww00). Each root was divided into 4 segments (distances are from the junction of the root apex and root cap): segment 1, 0-3 mm plus the root cap; segment 2, 3-7 mm; segment 3, 7-12 mm; segment 4, 12-20 mm. (For detatils of conditions see (1) with nutrient modifications as in (2)). The three normalized cDNA libraries were constructed in the lab of Hans Bohnert (University of Illinois-UC). Total RNA was extracted by the 'hot Phenol' method (Plant Molecular Biology manual. D5: 1-13, 2nd ed., 1997). This method worked in eliminating carbohydrate material present in the root tips. The integrity of the RNA was verified by denaturing agarose gels and spectrophotometry (ratio A260/280). Poly(A)+mRNA was isolated twice from total RNA was converted to double tranship and tractions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   bohnerth@life.uiuc.edu
was converted to double-stranded cDNA and tagged by using modified Oligo(dT) primers. One of 4 sequence tags corresponding to a different segment of the root was added to the 3'-end of the modified Oligo(dT) primers, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         normalized cDNA libraries. Dark-grown maize seedlings with primary roots 12-20 mm in length were transplanted to high (-0.03 MPa) or low water potential (-1.6 MPa) vermiculite, and harvested at 5 h and 48 h after transplanting.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            segment specific mRNAs into CDNAs. Each library contains all four tags. A suffix (81, 82, 83, or 84) has been added to each sequence identifier to designate which region of the root (Root segment 1, 2, 3, or 4) the sequence was found in based on the Identification of the tag. A suffix of 80 indicates that the sequence tag, and hence the source segment, could not be identified. The double stranded cDNAs were size-selected (>450 bp). Size selected cDNAs were adaptored with BCORI adaptors at both ends, and then digested with NotI. The CDNA was directionally cloned into ECORI-NOTI digested pBS II SK(+) phagemid vector (Stratagene) and electroporated into E.coli DH10B. The total number of white colony forming units (cfu) in the primary libraries before amplification was as follows: zmrws05: 3.37 x 106; zmrws088: 4.87 x 106; zmrww00: 3 x 106. The background of empty clones was less than 1%. Inserts ranged from -0.5kb to >2.5 kb, as determined by PCR. Plasmid DNA from the primary libraries then was converted to single-stranded circles and used as a template for PCR amplification using the T7 and T3 priming sites that flank the cloned cDNA inserts. The purified PCR products, representing the entite cDNA population cloned in each library, were used as a driver for normalization. Hybridization between the single-stranded library and the PCR products was carried out for 44 hours at 300C.

Non-bybridized single-stranded DNA circles were separated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Non-hybridized single-stranded DNA circles were separated from hybridized DNA rendezed partially double-stranded and electroporated into DH10B. The total number of clones with insert was: zmrws05: 2.0x107; zmrws48: 4.2x107; zmrws00: 1.1x107. The background of empty clones was less than 2%. Insert size, determined by PCR of the entire library, ranged from 0.5kb to 2.5kb. (1) Sharp R E; Silk W K; Hsiao T C. Growth of the Maize Primary Root at Low Water Potentials I. Spatial Distribution of Expansive Growth. Plant Physiology (Rockville). 87(1). 1988. 50-57. (2) Spollen W G; LeNoble M E; Samuels T D; Bernstein N; Sharp R E. Abscisic acid accumulation maintains maize primary root elongation at low water potentials by restricting enotype the production. Plant Physiology (Rockville). 122(3).
